

# Product Requirements Document (PRD)

**Product:** Proof of Work (PoW) Habit Tracker

**Author:** Saurav Avadheshsingh

**Date:** August 2026

**Status:** Draft / Ideation Phase

## 1. Executive Summary

We are building a "Proof of Work" accountability hub designed for builders, developers, and creators. While existing networking platforms (like Twitter and LinkedIn) are excellent for distribution, they are poor environments for granular, daily progress tracking. Our platform provides a dedicated, distraction-free environment for users to log daily habits, track streaks, and automatically generate highly aesthetic "Flex Cards" (data-rich visuals) optimized for sharing on major social networks.

## 2. Target Audience

- **Indie Hackers & Developers:** Tracking daily commits, side-project development, or learning new stacks.
- **Content Creators & Writers:** Logging daily writing habits or content production pipelines.
- **Fitness Enthusiasts:** Seeking public accountability without the noise of generic fitness apps.

## 3. Problem & Solution

**The Problem:** The "build in public" movement relies on consistent updates, but creating engaging daily posts is high-friction. Text-only posts lack visual appeal, and taking daily screenshots is tedious. Furthermore, the historical record of this effort is lost in chronological feeds.

**The Solution:** A centralized dashboard where users check off habits and upload proof (images/code snippets). The system automatically compiles a shareable image card ("Flex Card") displaying the current streak, proof, and a mini-consistency graph, creating a frictionless loop between doing the work and sharing it.

## 4. Competitive Analysis

| Competitor          | Strengths                             | Weaknesses                                                         | Our Differentiator                                                       |
|---------------------|---------------------------------------|--------------------------------------------------------------------|--------------------------------------------------------------------------|
| <b>PublicHabits</b> | Clean grid UI, public links.          | Lacks a viral social loop to bring users back; isolated ecosystem. | Direct integration with Twitter/LinkedIn via aesthetic image generation. |
| <b>HabitShare</b>   | Granular privacy, internal messaging. | Visually dated, strictly for close friend circles.                 | Focused on professional "flexing" and public accountability.             |
| <b>3act</b>         | Crew-based, strong photo-proof.       | Mobile-only, skewed heavily to wellness/fitness.                   | Desktop-first approach, GitHub-style contribution graphs for builders.   |

## 5. Core Features (MVP Scope)

### Epic 1: Frictionless Daily Log (Single-Player Mode)

- **Actionable Check-ins:** Fast binary (Done/Not Done) logging.
- **Proof Uploads:** Image upload support for screenshots/photos.
- **Streak Logic Engine:** Robust backend processing for time-zone aware streak calculations, including configurable "grace periods".

### Epic 2: The "Flex" Generator (Growth Engine)

- **Auto-Generated Assets:** Canvas/server-side generation of 1200x630 cards.
- **Card Anatomy:** Displays User Handle, Habit Name, Streak Count, Proof Image, and 7-day micro-graph.
- **1-Click Export:** Download or direct-share functionality.

### Epic 3: Public Profiles (System of Record)

- **GitHub-Style Grid:** A heat-map representation of consistency.
- **Aggregated Feed:** A historical timeline of all uploaded proof, functioning as a continuous portfolio.

## 6. Non-Functional Requirements

---

**Performance:** The Flex Card image generation must occur in under 2 seconds to avoid user drop-off.

**Reliability:** Streak calculations must be 100% accurate across all global timezones.

**Scalability:** Image storage must utilize a scalable cloud bucket (e.g., AWS S3) to handle high volumes of proof uploads.
