

Disciplr

A social productivity platform where habits, goals, and consistency are public — and your discipline has a score.

01

Problem & Vision

Millions of people want to build discipline but fail silently. Habit trackers stay private, accountability partners ghost, and streaks on Duolingo feel hollow. The core problem: **discipline without social stakes has no gravity.**

Private = easy to quit	No real feedback loop
When nobody sees your goals, there's no cost to abandoning them. The shame-exit is frictionless.	Apps give you green squares. None connect effort to identity or reputation.
Social media rewards consumption	Dopamine mismatch
Twitter/Instagram reward takes and aesthetics — not actual doing. The feed is the opposite of productivity.	The brain's reward hits when scrolling Instagram, not when finishing a workout. Disciplr fixes the alignment.

Vision: Build the world's first social network where reputation is built entirely on what you *actually do* — not what you post. Your Discipline Score becomes a signal others trust, like a credit score for personal reliability.

02

Target Users

Four primary personas, all sharing one core tension: they know what they want to achieve but struggle to stay consistent.

 Arjun, 24 Software engineer, Pune Wants to learn DSA, run 5k daily, read 20 books/year. Starts strong, dies in week 2. Needs external pressure.	 Priya, 28 Startup founder, Bangalore Tracks OKRs for her company but has zero system for personal goals. Motivated by competition and leaderboards.
 Rahul, 19 College student, Delhi Wants to build 'the grind' aesthetic. Loves proof of work. Would post workout logs if friends could see them.	 Neha, 32 Product manager, Mumbai Highly structured at work, chaotic personally. Wants to transfer work discipline into health and learning habits.

03

Core Concepts

Disciplr is built on three interlocking ideas. Understand these and the entire product logic follows.

847

Credence Score

Your **live XP counter**. Rises every time you check off a habit, hit a goal milestone, or log a completion. Acts like the dopamine hit — instant, public, visible. Decays slowly if you go inactive. Range: 0–1000.

732

Discipline Score

Your **CIBIL equivalent**. A rolling 90-day score based on consistency, not just effort. Tracks streaks, completion rates, goal honesty, and cadence regularity. Harder to move, harder to fake. Range: 300–900.

```
// Credence Score – instant gratification
credence += (task_weight x streak_multiplier x difficulty_factor)
credence -= decay_rate_per_missed_day

// Discipline Score – long-term reputation (like CIBIL)
discipline = weighted_avg(
consistency_rate_90d x 0.40,
goal_completion_rate x 0.30,
streak_longevity x 0.20,
public_accountability x 0.10
)
```

Feature Set

Features split into MVP (ship first), V2 (grow), and V3 (moat). Build in this order.

Goal Board

MVP

Users create public goals with deadline, category (health/career/learning/finance/creative), and visibility. Sub-milestones supported. Others can follow a goal and get notified on completion.

Habit Tracker — Public Streaks

MVP

Daily/weekly habits with one-tap check-in or photo proof. Streaks are public on your profile. Missing a day breaks the streak visibly. Streak freezes can be bought with Credence points (max 3/month).

Credence Feed

MVP

A social feed showing friends' completions, streaks, and goal milestones in real time. No text posts, no opinions — only activity. Think GitHub contribution graph meets Twitter.

Discipline Score Profile

MVP

Every user has a public profile showing Discipline Score (300–900), Credence points, active habits, goal completion %, and historical chart. Score is uneditable and algorithm-driven.

Challenges & Duels

V2

Challenge a friend to the same habit for 30 days. Loser's Credence takes a hit. Public challenges visible on both profiles. Creates natural virality — people invite friends to challenge them.

Accountability Circles

V2

Small groups (2–8 people) with a shared goal. Daily check-in. Miss twice in a row and the group's aggregate score drops — social pressure by design. Inspired by group lending models.

Leaderboards (City / Category / Global)

V2

Weekly leaderboards by city, category, and globally. Top 10 earn a 'Disciplined' badge that shows on their profile for that week. Resets weekly to give everyone a shot.

AI Goal Coach

V3

Claude-powered coaching based on Discipline Score history. Suggests habit adjustments, predicts goal completion dates, and flags failure patterns ('you always quit on Mondays').

Discipline NFTs / Verifiable Proof

V3

On completing a major goal (100 days of coding, marathon, etc.), earn a verifiable proof token. Can be shown on LinkedIn. Turns discipline into portable social capital.

05

Scoring Engine — Deep Spec

This is the core IP. The algorithm must feel fair, hard to game, and satisfying to progress.

Credence — point table

Daily habit check-in: **+10–50 pts** (difficulty 1–5 stars, user-defined). Goal milestone: **+100–500 pts**. Streak milestones (7/30/100 days): **1.5x / 2x / 3x multiplier**. Being cheered: +5 pts. Missed day: -5 pts. Streak break: $-(\text{streak_length} \times 2)$ pts, making long streaks worth protecting.

Discipline Score — anti-gaming rules

Only counts habits older than 7 days (prevents burst-and-quit gaming). Completion % is weekly rolling average. Self-reported goals trigger an honesty audit — consistently easy goals trigger automatic difficulty adjustment. Score never drops more than 30 points per week, preventing spiral discouragement.

Public accountability bonus

Every goal or habit with 5+ followers gets a +10% scoring multiplier. This incentivises sharing and drives virality organically. The more public you go, the more you earn.

06

Tech Stack — \$0 Forever

Every layer has a zero-cost tier covering you from 0 to 10,000 users. No surprises, no credit card charges.

Why \$0 is achievable: Vercel (frontend), Supabase (DB + auth + realtime), Cloudflare (CDN + edge), and Resend (email) all have free tiers that comfortably handle 10K MAU. You only pay when you win.

Frontend	Next.js 14	App router, RSC, zero config. Vercel free tier (100GB bandwidth/mo).
Database	Supabase	Postgres + auth + realtime + storage. Free: 500MB DB, 1GB storage, 50K MAU.
Auth	Supabase Auth	Google/GitHub social login + OTP email. Included in Supabase free tier.

Realtime	Supabase Realtime	Postgres CDC for live feed. 200 concurrent connections on free tier.
Styling	Tailwind + shadcn/ui	Zero runtime CSS. shadcn/ui for accessible component primitives.
CDN / Edge	Cloudflare Free	Unlimited bandwidth, DDoS protection, image optimisation free tier.
Email	Resend	3,000 emails/mo free. Streak reminders and check-in nudges.
Push notifis	Web Push API	Native browser push, zero cost. PWA via next-pwa.
Analytics	Posthog Free	1M events/mo free. Full analytics, funnels, session replay.
AI (V3)	Claude API	Anthropic API for Goal Coach. Use prompt caching to minimise cost at scale.

```
// Supabase schema — core tables
users: id, username, avatar_url, credence_score, discipline_score, created_at
habits: id, user_id, name, frequency, difficulty, is_public, streak_count
goals: id, user_id, title, category, deadline, milestones[], visibility
checkins: id, habit_id, user_id, checked_at, proof_url, points_earned
follows: follower_id, followee_id, goal_id (goal-level or profile-level)
score_history: user_id, credence, discipline, recorded_at // daily snapshot
```

07

Roadmap

Aggressive but achievable for a solo dev or small team. Each phase has a clear north-star metric.

● Phase 1 — Weeks 1–6

MVP: Core loop works end-to-end

Sign up → create public goal/habit → daily check-in → see Credence go up → friends' activity in feed → view Discipline Score profile. Ship to 100 beta users. North-star: 7-day retention > 40%.

● Phase 2 — Weeks 7–12

Growth: Challenges + Accountability Circles

Add Challenges, Circles, and weekly Leaderboards. Launch on Product Hunt. Target 1K registered users. Instrument virality loop: challenge invite → friend joins → both stay. North-star: K-factor > 0.4.

● Phase 3 — Month 4–6

Engagement: Mobile PWA + push notifications

Convert to full PWA with push reminders. Add streak freeze mechanic. Daily digest emails. Introduce city leaderboards (strong cultural hook for Indian metros). Target 10K MAU.

Moat: AI Coach + Discipline API

Claude-powered goal coach. Discipline Score API so third-party apps can read your score (job applications, loan apps, date apps that care about reliability). Long-term network effect moat.

08

Success Metrics

09

Risks & Mitigations

High	Check-in fraud (tapping without doing) Optional photo proof, peer reporting, and the Discipline Score requiring sustained 90-day patterns. Burst gaming won't move it. Honesty audit flags suspiciously perfect records.
High	Shame spiral causing churn Discipline Score decay is slow and recoverable. Private 'resting' mode for mental health breaks (score pauses, doesn't drop). Never show negative feedback — only show path to recovery.
Medium	Cold start — nobody to follow Seed with 20–30 power users before launch. Show 'trending goals' from all users even to new signups. Allow anonymous browsing to demonstrate value before signup friction.
Medium	Supabase free tier limits at scale Schema is migration-friendly. At 10K MAU you'll have validation to raise or monetise. Archive old check-ins to object storage. Score history is append-only and compressible.
Low	Feature creep delaying launch PRD defines hard MVP scope. V2 and V3 are explicitly out-of-scope until 1K users. Build the loop first.
